Office Action Summary

Application No.

09/305,313

Applicant(s)

MATSUURA, TAKAHIRO

Examiner

Colin M. LaRose

Art Unit

2623

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 06 October 2004.
- 2a) ☒ This action is FINAL. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,3-9 and 11-17 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,3-9 and 11-17 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

Art Unit: 2623

DETAILED ACTION

Arguments and Amendments

1. Applicant's amendments and arguments filed 6 October 2004, have been entered and made of record.

Response to Arguments

2. Applicant's arguments with respect to claims 1, 9, and 17 have been considered but are unpersuasive. It is believed that claims 1, 9, and 17, as presently amended, are still unpatentable over the combination of U.S. Patent 5,136,401 by Yamamoto et al. and U.S. Patent 5,442,717 by Murakami. The rationale is given below in the statement of the rejection for claims 1, 9, and 17.

Claim Rejections - 35 USC § 103

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

4. Claims 1, 3-6, 9, 11-14, and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 5,136,401 by Yamamoto et al. ("Yamamoto") in view of U.S. Patent 5,442,717 by Murakami.

Regarding claims 1, 9, and 17, Yamamoto discloses an image processing method/product/apparatus (figure 1) for performing the steps of:

detecting an image area contained in an inputted image having a frame image, wherein the detected image area does not include the frame image of the inputted image (inner frame area

Art Unit: 2623

detecting circuit 6 (viz. 91, figure 9): detects area inside frame, such as the area that includes “D” and “F” in figure 2B);

generating correction information of the detected image area (inner frame area detecting circuit 6 (viz. 92, figure 9) outputs an “area color signal,” which is used as correction information);

correcting the image area based on the generated correction information (image layout circuit 7 uses the “area color signal” to correct the area within the frame);

wherein, in said detecting step, the frame image, which has gradation, is differentiated from the detected image area by using a detection method that detects pixels by determining whether or not a pixel of interest and pixels adjacent to the pixel of interest have a same hue (figure 8B: the pixels in the image are classified as having one of four hues (yellow, green, blue, and red) by the inner frame area detecting circuit 6), and recognizes the frame image, which has gradation, by detecting the upper, lower, left, and right ends of the frame image from the detected pixels (color frame discriminating circuit 6 recognizes frames that comprise loops of consecutive pixels, as shown in figures 2B, 20, and 21; the frame image surrounding the “D” and “F” characters in figure 2B comprises upper, lower, left, and right ends, which are necessarily detected in order to determine the area that the frame encloses).

Yamamoto does not expressly disclose that the pixels of the image (i.e. the pixel of interest and any adjacent pixels) are determined to have a difference between lightness and saturation having a predetermined value or less.

As shown in figure 8B, pixels classified as red, yellow, green, or blue must have a certain minimum amount of saturation (the saturation being represented by the radial distance from the

Art Unit: 2623

origin). However, there is no mention of the pixels having a difference between lightness and saturation being a predetermined value or less.

Murakami discloses an image processing system, wherein a reference color is designated, and pixels of interest within an image are compared to the reference color to determine if the pixels of interest are substantially the same color as the reference color.

In particular, Murakami calculates a difference between each of the hue, saturation, and lightness values of the reference color with the hue, saturation, and lightness values of the pixel of interest. The pixel of interest is considered to match the reference color if the reference color and the pixel of interest have the same hue (i.e. the difference in hues is substantially small), and the differences between lightness and saturation are a predetermined value or less (i.e. the differences in lightness and saturation are substantially small). In column 10, lines 1-13, dH, dS, and dL are calculated, and in column 12, lines 37-60, the values are compared to predetermined thresholds to determine if the color of the pixel of interest and the reference color are the same.

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Yamamoto by Murakami to achieve the claimed invention by computing the difference in hue, lightness, and saturation values of each of the pixels in the image and the four frame colors (red, blue, green, and yellow) in order to classify each of the pixels as one of the four frame colors, since Murakami shows that matching a pixel to a reference color is conventionally achieved by a comparison of the hue, lightness, and saturation values of the pixel and the reference color, and Murakami's classifying of pixel colors by direct comparison to the reference color would achieve substantially the same results as Yamamoto's method of simply partitioning the color space in order to classify the pixels by color.

In other words, Murakami and Yamamoto are functionally equivalent methods of classifying pixels by color since both methods classify a pixel of interest as matching a reference color when the pixel of interest is substantially close to the reference color (i.e. within a certain tolerance range of the reference color).

Regarding claims 3 and 11, Yamamoto discloses identifying the image area other than the frame image based on a detection result of the pixel constructing the frame image (inner frame area detecting circuit 6 (viz. 91, figure 9) identifies area inside frame) and supplying information representing the identified image area to the generator and corrector (inner frame area detecting circuit 6 (viz. 91, figure 9) supplies detected area information to the generator (92, figure 9) and the corrector (7, figure 1)).

Regarding claims 4 and 12, Yamamoto discloses detecting comprises scanning the image in the horizontal direction in units of columns and detecting, as two ends of the image area in the horizontal direction, a first column having a pixel determined not to construct the frame image and a next column having a pixel determined to construct the frame image (column 11, line 66 through column 12, line 4: Yamamoto sequentially scans the image to determine the metes and bounds of the frame image; the image is in raster format (i.e. rows and columns of pixels), so detecting a left or right edge of the frame comprises detecting a pixel in a first column that constructs the frame and a pixel in a second column that does not construct the frame).

Regarding claims 5 and 13, Murakami discloses detecting comprises scanning the image in the vertical direction in units of rows and detecting, as two ends of the image area in the vertical direction, a first row having a pixel determined not to construct the frame image and a

Art Unit: 2623

next row having a pixel determined to construct the frame image (column 11, line 66 through column 12, line 4: Yamamoto sequentially scans the image to determine the metes and bounds of the frame image; the image is in raster format (i.e. rows and columns of pixels), so detecting a top or bottom edge of the frame comprises detecting a pixel in a first row that constructs the frame and a pixel in a second row that does not construct the frame).

Regarding claim 6 and 14, yamamoto allows for re-execution of identification processing of an image area other than the frame after correction has ended for situations in which further correction is desired. The detector in Murakami's disclosure is part of an application stored in a computer that is able to re-identify and reprocess image areas an arbitrary number of times.

Claim Rejections - 35 USC § 103

5. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

6. Claims 7, 8, 15, and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yamamoto in view of Murakami, and further in view of U.S. Patent 6,351,558 by Kuwata.

Regarding claim 7, 8, 15 and 16, Murakami teaches performing sharpness processing on the detecting image area.

Murakami is silent to generating, as correction information, highlight and shadow portions and white and black balances, and using said highlight and shadow points and white and black balances to correct the image.

Kuwata discloses generating, as correction information, highlight and shadow portions (column 9, lines 42-52) and white and black balances (figure 18) to be corrected or adjusted, and

Art Unit: 2623

then correcting the gradation of an image area based on highlight and shadow points (column 26, lines 43-67) and black and white balances (figures 22-23).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Murakami by Kuwata to include correcting the image portion according to highlight/shadow points and black/white balance since Kuwata that performing the claimed corrections improves image quality.

Conclusion

5. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Colin M. LaRose whose telephone number is (571) 272-7423. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Amelia
